

OPEN SOURCE / GPLv3

Most antivirus is a black box.

Eyil Guard is the opposite.

Open-source endpoint protection for
Windows, built around transparency.

Calm by default

A plain verdict and an always-visible health bar.

It tells you what it caught

Only what needs attention gets a card.

⚙️ — □ ×

Demo data. The engine isn't connected, so these files are illustrative — not live detections. Start the engine to see real verdicts.

EYIL GUARD

One thing needed me.
I stopped something and tucked it away. Here's what happened.

Eyil Guard

Write your own rules

Plus your own feed keys. Everything stays local.

How it works

- 1 A file opens, or a program runs.
- 2 The kernel minifilter pauses it and asks the local engine.
- 3 The engine checks five sources: ClamAV, YARA, a hash blocklist, behavior, and live network connections.
- 4 The verdict blocks the open if needed, and shows up in the dashboard, in plain English.

Everything stays on 127.0.0.1.

Eyil Guard

Built in the open.

The engine, real-time monitoring, and the dashboard run today. Kernel-level blocking is in active testing and works on a VM, with code-signing next.

Early and built in the open, so for now pair it with your current antivirus rather than replacing it.

Open source, GPLv3
